## E-244 REMOTE SPEED SET

The E-244 Remote Speed Set board is used with the Precision Governors, Inc. model E-201 6-terminal governor to provide an additional speed set point. This set point can be any speed below the governing speed set within the E-201 module. When the switch (or relay) shown in the wiring diagram below is closed, the governing speed is set by the E-244. When this switch is open, the governing speed is that of the E-201.

The E-244 board is conformal-coated for some protection against moisture, dirt, and vibration. However, it is *highly* recommended that the board be mounted in such a manner as to provide protection from the elements.
